

# NIH-FDA Pediatric Drug Development Process

## FDA Stakeholders Meeting

March 25, 2015

Anne Zajicek, MD, PharmD  
Chief, Obstetric and Pediatric  
Pharmacology and Therapeutics  
Branch

# Pediatric Drug Development: The Best Pharmaceuticals for Children Act

# NIH Role

- Prioritize therapeutic areas and therapies in need of study
- Sponsor pediatric clinical trials
- Submit data to FDA for consideration of labeling changes

# Goals

- **Direct**

- Pediatric labeling
- Improving infrastructure
  - Training pediatricians and others designing and performing pediatric clinical trials
  - Creating a master contract for clinical trials performance

- **Indirect**

- Increasing collaborations between NIH and FDA
- Improving academic clinical research

2002: Master List of all Off-Patent Drugs  
which lack adequate pediatric labeling

Consider for prioritizing:

- Availability of S/E data
- Are additional data needed?
- Will new studies produce health benefits?
- Reformulation?

Consultation with  
experts in pediatric  
practice and research

Develop, prioritize, publish an  
Annual List of Drugs

## 2007, 2012: Therapeutic Areas

Consider for prioritizing:

- Therapeutic gaps
- Potential health benefits of research
- Adequacy of necessary infrastructure

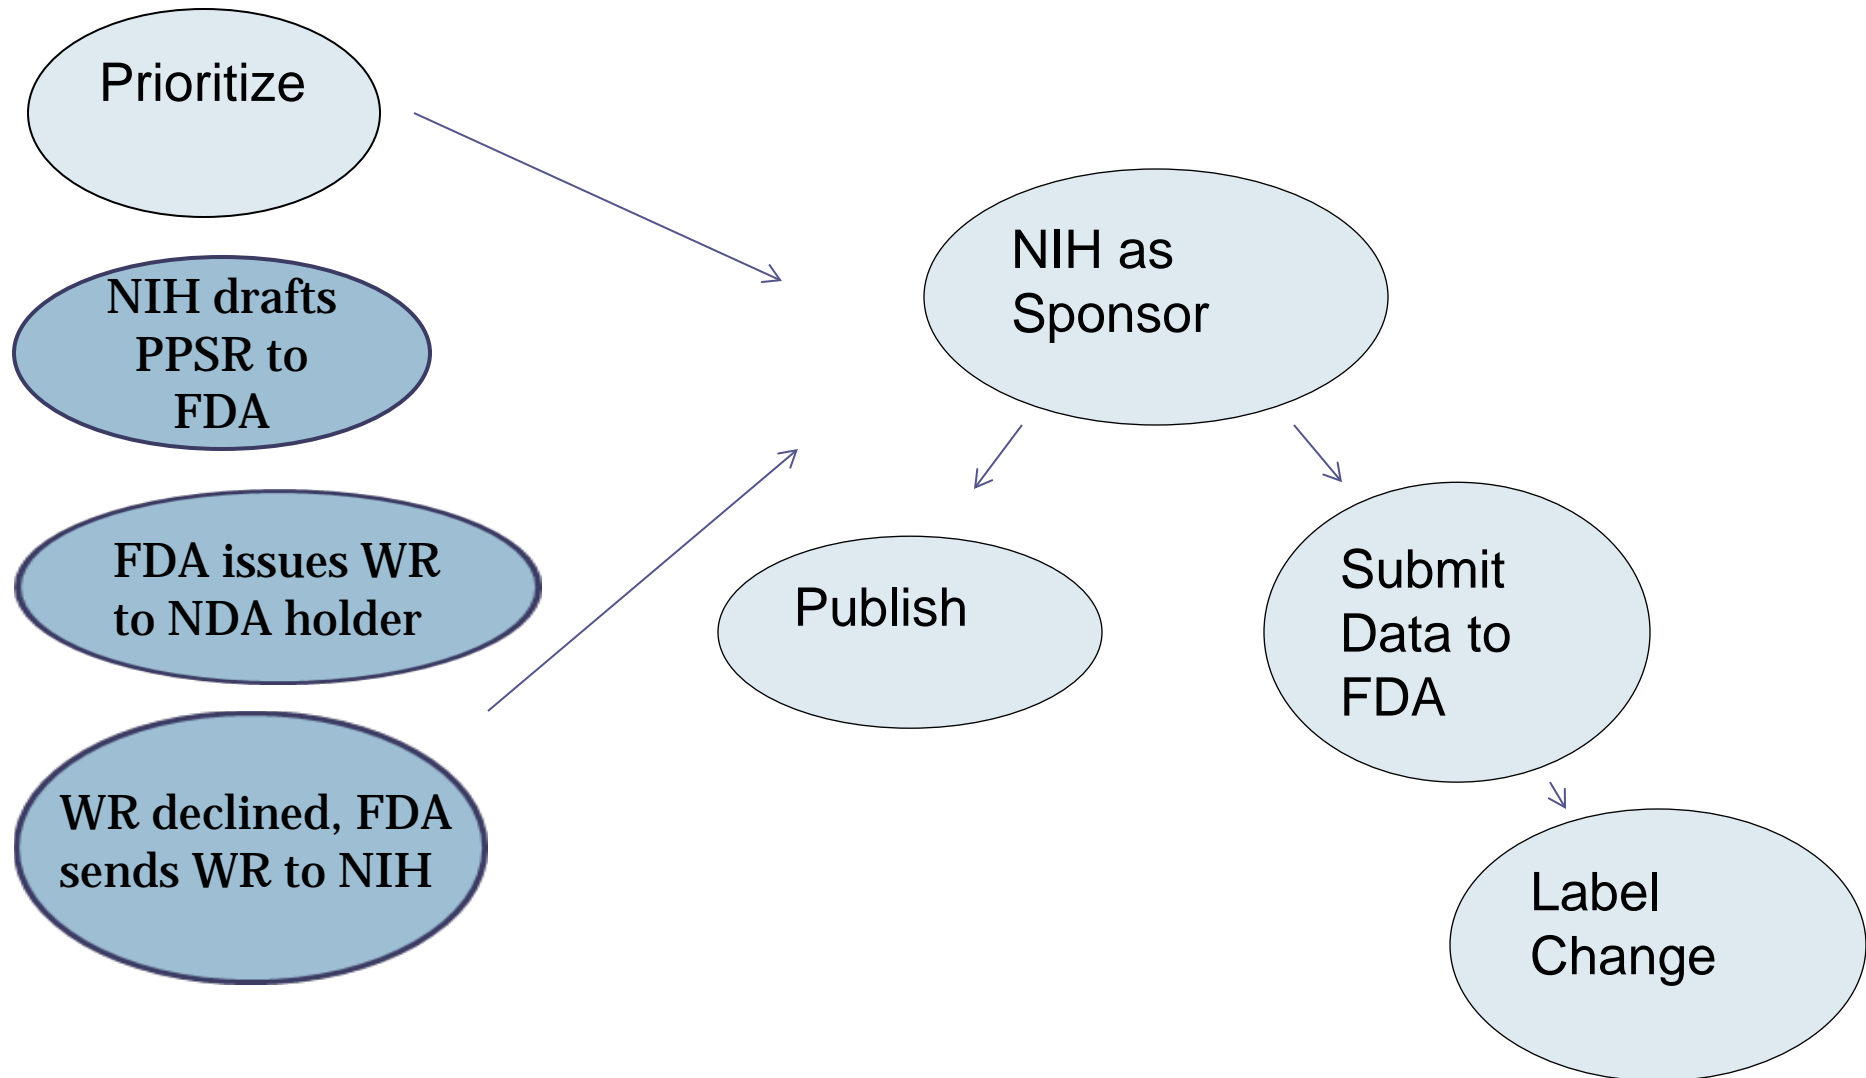

Consultation with experts in pediatric practice and research

Develop, prioritize, publish an Annual List of Therapeutic Areas and Specific Needs

# Prioritized Therapeutic Areas

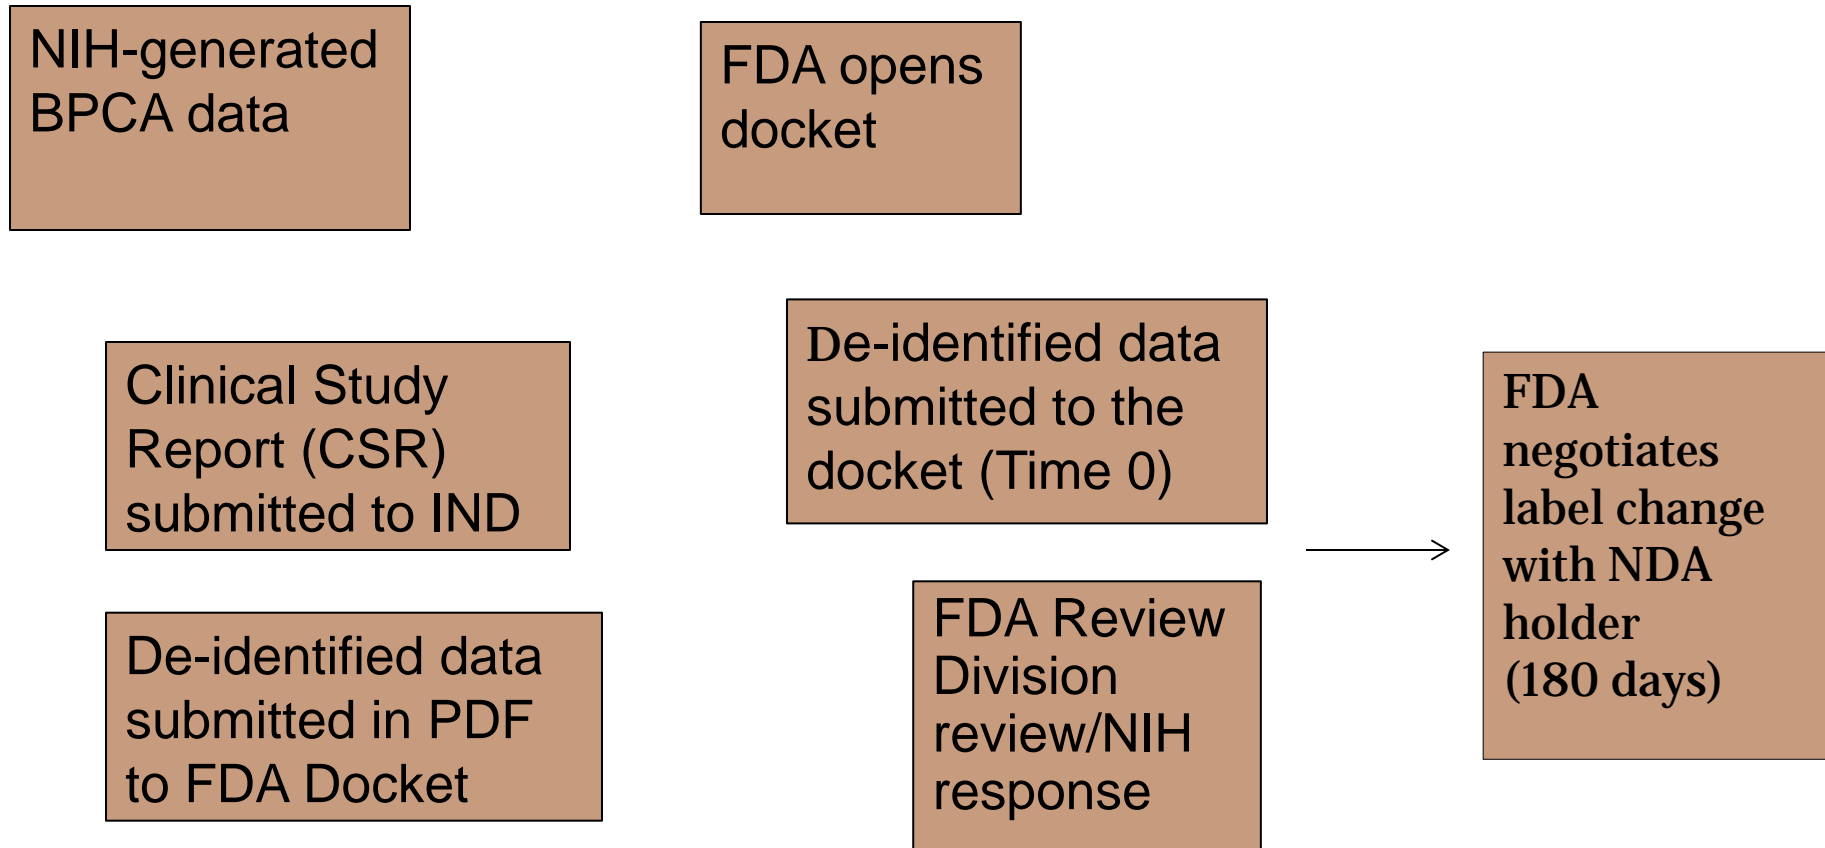

<b>Cardiovascular Disease</b>	<b>Hypertension, Hypotension, Dyslipidemia</b>
<b>Respiratory Disease</b>	<b>Asthma, Pulmonary Hypertension</b>
<b>Infectious Diseases</b>	<b>MRSA, General Infections, Tinea capitis, Tuberculosis, Parasitic Infections, Influenza</b>
<b>Psychiatry</b>	<b>ADHD, Bipolar Disease, Safety of Atypical Antipsychotics</b>
<b>Adolescent Medicine</b>	<b>General therapeutic needs, Over the counter meds</b>
<b>General Pediatrics</b>	<b>Corticosteroids, Cold and Cough Medicines, *Constipation</b>
<b>Formulations</b>	<b>Technology advances</b>
<b>Oncology</b>	<b>Neuroblastoma, Leukemia, Solid Tumors, Formulations</b>
<b>Neurology</b>	<b>Cerebral Palsy, Migraines, Seizures</b>
<b>Intensive Care</b>	<b>Anesthesia, Sedation</b>
<b>Dermatology</b>	<b>Atopic Dermatitis, Severe inflammatory skin disease, Hemangiomas</b>
<b>Rheumatology</b>	<b>Connective tissue disorders</b>
<b>Bio-defense research</b>	<b>Nerve agent exposure, Organophosphate poisoning, Cyanide toxicity</b>
<b>Renal Diseases</b>	<b>Acute kidney injury, Anemia</b>
<b>Hematology</b>	<b>Sickle Cell Disease, Thrombosis</b>
<b>Rare diseases/Endocrine</b>	<b>Fragile X, Type-1 Diabetes, Formulations</b>
<b>Gastroenterology</b>	<b>GE Reflux, Cholestatic disease, Cyclic vomiting, *IBD</b>
<b>Neonatology</b>	<b>BPD, Pain, Neonatal abstinence syndrome, NEC</b>
<b>Special considerations</b>	<b>Intellectual and developmental disabilities</b>
	<b>Pediatric Formulations, Devices</b>

# NIH BPCA Process

# BPCA Data Submission Process from NIH to FDA

# Why Is This Novel?

- NIH and **pediatric stakeholders** can determine which products are in need of labeling changes
- Sponsor: NIH, not pharma
- Label owner: pharma, not NIH or FDA
- FDA negotiates the new pediatric labeling with pharma
- Neither FDA or investigators can put information into a label without sponsor agreeing. This process says the sponsor must come to the table.

# Sodium Nitroprusside

- **Pediatric Use:** Efficacy in the pediatric population was established based on adult trials and supported by the dose-ranging trial (Study 1) and an open label trial of at least 12 hour infusion at a rate that achieved adequate MAP control (Study 2) with pediatric patients on sodium nitroprusside. No novel safety issues were seen in these studies in pediatric patients.

# Label

- The effects of sodium nitroprusside to induce hypotension were evaluated in two trials in pediatric patients less than 17 years of age. In both trials, at least 50% of the patients were pre-pubertal, and about 50% of these pre-pubertal patients were less than 2 years of age, including 4 neonates. The primary efficacy variable was the mean arterial pressure (MAP).
- There were 203 pediatric patients in a parallel, dose-ranging study (Study 1). During the 30 minute blinded phase, patients were randomized 1:1:1:1 to receive sodium nitroprusside 0.3, 1, 2, or 3  $\mu\text{g}/\text{kg}/\text{min}$ . The infusion rate was increased step-wise to the target dose rate (i.e., 1/3 of the full rate for the first 5 minutes, 2/3 of the full rate for the next 5 minutes, and the full dose rate for the last 20 minutes). If the investigator believed that an increase to the next higher dose rate would be unsafe, the infusion remained at the current rate for the remainder of the blinded infusion. Since there was no placebo group, the change from baseline likely overestimates the true magnitude of blood pressure effect. Nevertheless, MAP decreased 11 to 20 mmHg from baseline across the four doses (Table 1).
- There were 63 pediatric patients in a long-term infusion trial (Study 2). During an open-label phase (12 to 24 hours), sodium nitroprusside was started at  $\leq 0.3 \mu\text{g}/\text{kg}/\text{min}$  and titrated according to the BP response. Patients were then randomized to placebo or to continuing the same dose of sodium nitroprusside. The average MAP was greater in the control group than in the sodium nitroprusside group for every time point during the blinded withdrawal phase, demonstrating that sodium nitroprusside is effective for at least 12 hours.
- In both studies, similar effects on MAP were seen in all age groups.

**Pediatric Use**

\*addition of pediatric patients less than 3 months of age with complicated intra-abdominal infections

Evelyne Jacqz-Aigrain. *Editorial Commentary:*  
Effectiveness or Efficacy: Which Study to Evaluate  
Antibiotics in Neonates?

*Clin Infect Dis.* 2012 Dec;55(11):1503-4.

- Additional data on efficacy will be provided by 2 studies called NeoMero 1 and NeoMero 2 (NTC01551394 and NT015544124, respectively), both conducted in Europe in infants <90 days of age with bacterial meningitis or late-onset sepsis. At completion date (estimated to be July 2014), meropenem will have a complete and very informative evaluation in neonates, conducted step by step, based on a population PK study, the intermediate effectiveness and safety evaluation published today, a randomized controlled trial for efficacy in neonatal sepsis, and additional PK data in neonatal meningitis. This will hopefully allow a marketing authorization for meropenem in neonates for the treatment of suspected or proven infection, including complicated forms (intra-abdominal infection, meningitis), but obtained >15 years after marketing authorization in infants.
- Therefore, the question remains of how to evaluate antibiotics in neonates: **Is a randomized controlled trial (RCT) always required for an effective and safe use of antibiotics in neonates or to receive a marketing authorization?**

## **Pediatric Patients Less Than 3 Months of Age**

For pediatric patients (with normal renal function) less than 3 months of age, with intra-abdominal infections, the MERREM I.V. dose is based on gestational age (GA) and postnatal age (PNA). (See dosing table below). MERREM I.V. should be given as intravenous infusion over 30 minutes.

<b>Recommended MERREM I.V. Dosage Schedule for Pediatric Patients Less than 3 Months of Age with Complicated Intra-Abdominal Infections and Normal Renal Function</b>		
<b>Age Group</b>	<b>Dose (mg/kg)</b>	<b>Dose Interval</b>
Infants less than 32 weeks GA and PNA less than 2 weeks	20	Every 12 hours
Infants less than 32 weeks GA and PNA 2 weeks and older	20	Every 8 hours
Infants 32 weeks and older GA and PNA less than 2 weeks	20	Every 8 hours
Infants 32 weeks and older GA and PNA 2 weeks and older	30	Every 8 hours

There is no experience in pediatric patients with renal impairment.

Wang WC, Ware RE, Miller ST, et al. Hydroxycarbamide in very young children with sickle-cell anaemia: a multicentre, randomised, controlled trial (BABY HUG).

*Lancet* 2011;377(9778):1663-72

### Findings

96 patients received hydroxycarbamide and 97 placebo, of whom 83 patients in the hydroxycarbamide group and 84 in the placebo group completed the study. Significant differences were not seen between groups for the primary endpoints (19 of 70 patients with decreased spleen function at exit in the hydroxycarbamide group *vs* 28 of 74 patients in the placebo group,  $p=0.21$ ; and a difference in the mean increase in DTPA glomerular filtration rate in the hydroxycarbamide group versus the placebo group of 2 mL/min per  $1.73 \text{ m}^2$ ,  $p=0.84$ ). Hydroxycarbamide significantly decreased pain (177 events in 62 patients *vs* 375 events in 75 patients in the placebo group,  $p=0.002$ ) and dactylitis (24 events in 14 patients *vs* 123 events in 42 patients in the placebo group,  $p<0.0001$ ), with some evidence for decreased acute chest syndrome, hospitalisation rates, and transfusion. Hydroxyurea increased haemoglobin and fetal haemoglobin, and decreased white blood-cell count. Toxicity was limited to mild-to-moderate neutropenia.

# Hydroxyurea

# Isotretinoin

# Vincristine, Actinomycin-D

- Relationship of dose, PK, age and other parameters to veno-occlusive disease
- Studies:
  - Line-clearing method
  - PK
  - Chart review to gather PD data on neurotoxicity, hepatotoxicity; dosing, demographics
  - PK-PD modeling

# Neonatal Research Network: Pilot study to treat neonatal hypotension

(Batton BJ et al. J Peds 2012; 161:65-69)

- Design: factorial (hydrocortisone/ dopamine)
- Results: 366 infants screened, 10 enrolled
- Issues: eligibility (indomethacin contraindicated with HC), consent

# Validating Endpoints for Neonates with “Hypotension”

- **Questions:**

- How is BP measured in the NICU?
- Have these methods been standardized or validated in this population?
- What is a normal neonatal BP at a given gestational or postnatal age?
- What is the definition of hypotension?
  - Value – systolic/diastolic/mean BP
  - “Perfusion”
  - Shock
  - Oliguria or anuria
- What is the clinical endpoint in the treatment of hypotension?
- How is this endpoint measured?

Batton B et al. Evolving blood pressure dynamics for extremely preterm infants. J Perinatol 2014; 34:301-305

**Figure 2.** Gestational age-specific changes in the systolic (a), diastolic (b) and mean (c) arterial blood pressure 50th percentile curves over the first 24 h.

Center variation in the rate of antihypotensive therapy administration, frequency of low BP, and incidence of hospital survival.
